What you added/changed since the above???

Since virtually everything is packed in DLLs these days, it's not simple to look at overall object file sizes or library functions. I'm not aware of a facility to determine the object size of "stuff", but that doesn't mean there is something.

I think I'd concentrate on the first question, though, followed by "what's the problem?" Is load time excessive, are you running out of memory, just curious, ... ?
