Mike,

Thank you for your response. Can you please show me how I add nodes to a tree node, and the rest I will look up, because I am really having difficulty with this, I am not just being lazy, I really am having problems. It shouldn't be too difficult to correct my code. But I also need the following feature:

If a certain node already exists, I mustn't add it twice (because a path must be unique).

If you are absolutely sure VB does explain this, can you post the exact url (in msdn6 format)

tia.
