If the directory is empty then Rmdir works fine.
If the directory has files then you need to Kill all files in the directory then use Rmdir
This will give error if any of the files are in use, so you need to add error handling.
Kill "C:\Temp*.*"
Rmdir "C:\Temp"

If the directory has files and sub directories then better use the SHFileOperation API, with option to delete to the Recycle Bin or not. The API has it is own error handling.
