Talking about bug fixes in old code... boy.. I /almost/ contacted a company a few weeks ago that wanted their DOS basic apps migrated to windows. If the thought of working in Quickbasic wasn't bad enough, I just *knew* the code would be full of spaghetti after 15 years of maintenance. That scared me off. If they happen to be still interested in a few months, I may actually do it <g>

I can understand that sentiment!

DLL Hell problems? Try ComGuard – <http://www.vbsight.com/ComGuard.htm>

Well it is a different language

That's for sure!

The upside is that us old gits will soon be worth serious bucks
– you want your bug fixed – price \$10,000
– you want your system re-written – price \$500,000 (plus risk)

<g> I'm too tired to take on more work like this...
