I need to hear from you experts what database system you prefer to use when you're creating a VB6 app that is going to need an \*affordable\* (relatively low budget) back-end database. The system might have at most 15 users at any one time.

To give you a bit of a benchmark, though I have used SQL Server in the past, I think SQL Server is too high-end for this current job. 'Access' might do (you tell me), or even MySQL, or something else you might mention.

My priority is keeping costs down, but, most importantly, finding a database that works well with VB6.

Thank you in advance for any/all feedback that you'd care to share.

.
