I would like to include mdac_type.exe with my installation files and then coax the P&D wizard to run the file on any target machine a program is installed on. Is this possible?

Not sure what the problem is. The mdac_type is often included with any package that needs it, based on the rules in VB6Dep.ini file. Coaxing is not required.

Be aware of one Gotcha! The P&D will include what ever mdac is in the ..\Wizards\PDWizard\Redist folder. Not the one you have installed on your build machine. Be sure to copy the mdac version you are using into this folder before building a package.

Just to make sure I'm following, if I make sure the version of MDAC I want to install is in the ...\.redist folder the installer automatically run the MDAC installer?

Thanks,
Mike
