I have a component that runs fine on a server, but from my local machine will not run. All it does is open an xml file. The line below that is commented out is the original that runs fine and the uncommented line is one I tried by setting a reference to my own local msxml component. I have granted full access permissions to everyone for the file but it still gets into the err.raise -11 portion. In another vb program, I'm calling this code and right before it I use the filesystemobject and I can open the file and read it. So, I'm stumped as to what might be wrong. Anyone have any ideas of something else I could try? thanks.

```
'Set xmlDoc = CreateObject("Msxml2.DOMDocument.3.0")
Set xmlDoc = New MSXML2.DOMDocument30
xmlDoc.async = False
IsOk = xmlDoc.Load(FilePath)
If Not IsOk Then
Err.Raise -11, "GetString", "Problem Opening Source"
Set xmlDoc = Nothing
Exit Function
End If
```

.
