

Reading Binary into array.

Guys,

First let me apologies for pestering you all... but so far all the advice has helped my application move along way from theory stage to working stage...

I'm wanting to work with a file as binary, but as part of my application will allow an offset into the file, and the filesize will be a maximum of 64kb, I'm thinking it might be easier to work with the file within an array (reading it into it) or something, so the offset can just work within the array rather than reading the file constantly of the drive.

Is there an easy way to achieve this? various Google searches have turned a few things up, but they either look too complicated for my needs to seemed to be geared towards vb.net rather than vb6.

Hope someone can help

Regards
Paul.
