Hi,

I have trying to load data into combobox by using

```
temp = rs!id  
combo.additem rs!name,temp
```

i am not sure why does it gives me error that invalid procedure or call?

if i try putting brackets for example  
combo.additem (rs!name,temp)  
error pop up as = is expcted.

what am i doing wrong?

could anyone please help me.

The combobox that ships with VB has no support, at all, for multiple columns.

What you seem to be trying to do is set the ItemData property

```
With combo  
.AddItem rs!name  
.ItemData(.NewIndex) = temp  
End With
```
