"Robert Morley" <rmorley@xxxxxxxxxxxxxxxxxxxxxxxxxx>'s wild thoughts were released on Tue, 10 Jul 2007 14:14:46 -0400 bearing the following fruit:

How does MZ Tools help with this? I've only had time to look at a few basic functions of it so far.

You can create templates, for example you can use a template to insert your error code. MZTools can automatically insert the name of the routine, the name of form/module as part of that template.

Besides that it has tons of time saving features. And it's free.

Rob

LurfysMa <invalid@xxxxxxxxxxxxxxxxxxxxxx>'s wild thoughts were released on Tue, 10 Jul 2007 10:11:28 -0400 bearing the following fruit:

Is there a way to get the name of a function into a variable in that function?

I like to put the function name in the title field in MsgBox and other debugging messages:

Re: Does each routine know its name?

```
Call MsgBox("Some message",,"function name")
```

I have been using a constant:

```
Public Sub CoolFunction(p1, p2, ...)  
Const smynome As String = "CoolFunction" 'Name of this  
routine
```

Then I can write:

```
Call MsgBox("Some message",,smyname)
```

If I ever change the function name, I only have to change that one constant, but it would be better if the constant could obtain the name automatically or even better if there is a property that would return the function name.

me.name?

Do you change function names often?

Why do you want this anyway? The reason I ask is the only scenario I've come across is for logging error information. In which case you obviously don't have MZtools ;-)
