I ran into a problem using a custom ActiveX I wrote in VB 2005.

It has a property that is "indexed" – that is, it has a parameter and needs to be addressed as (Index) – kinda like this:

```
MyActiveXControl.MyProperty(Index)
```

The thing is, VB2005 refuses to recognize that this property exists. Other – non-indexed – properties work ok, and show up in the little helper window as I type in the code, but the indexed properties do not show up and do not work. VB 2005 refuses to see them.

I tried rewriting those as methods – with Index as a parameter and the value as the method return. I hit another snag – if the method is called "MyMethod" in the ActiveX, VB 2005 sees it as "get\_MyMethod" – BUT when you call "get\_MyMethod" it complains that it doesn't exist.

Am at my wits' end here. Anyone hit this snag before and knows how to fix it???

.
