Ken Halter wrote:

What's funny (dotNot) is... some of the guys here use Paint Shop Pro... have been for years. When they released their latest, of course everyone here wanted an "upgrade"... and got one.

Oh oh... I haven't even considered that, since JASC sold out to Corel.

Seems that PSP migrated to dotNet,

<shudder!>

so of course, a program that used to "snap to life" now crawls out from under a rock,

Wow, v8 is pretty bad. (What I use currently.) I do remember the *snap* back several versions earlier. If they kept that same downward trajectory going...

guess what? <g> Not one person here uses the upgrade. They removed it and re-installed the newest "pre-dotNet" version they could find.

<g>

As soon as dotNet is introduced, "useful" functionality, as opposed to functionality some hotshot dotNetter thinks is important at the time, goes down the tubes, along with any hint of performance....

Yep, because above all else, the dotnet developer is selfish to the core. They think that because they're writing fewer lines of code, that's all that matters.

Re: VB6 lives?

but, one thing's for certain. The apps are "up to date", since, during startup, the user is forced to endure their "checking for updates" dialog.... actually, it's probably not checking for updates... it's probably just finding excuses to take so long to start <g>
