Private Property Let ResetCollection(info() As clsInfo)

Others already addressed the behaviour (For Each would be my suggestion as well) but I thought I would focus your attention to the syntax you are creating.

Resetting your collection is a task, a job you want accomplished when called. It would not do well as a property. A property is a value, a state the computer is currently in. The syntax you create by making it a property is of the form:

```
MyInfo.ResetCollection = NewInfo
```

Making it a property could lead some to (possibly) assume there are multiple collections in effect here. The initial collection the class supports and this ResetCollection which is assigned as shown above.

If it were up to me, I'd say ResetCollection needs to be a Sub.
