

Using a database

I have a PostgreSQL database on my machine created by an app I purchased. I would like to read this database and extract some data the app doesn't provide, and create a report.

I've written a number of VB6 apps but haven't the slightest clue where to start with a database. I've been Googling and reading but everything assumes a level of understanding far beyond mine.

I've found an interactive terminal in my start menu and even listed the commands. But at this point I'm stumped.

How do I determine the names of the data fields, open it, and sequentially read through it?

Any help would be greatly appreciated.
