Dear NG,

When creating an enhanced meta file the resolution is set to the resolution of the device context.

Now, I have two ways to influence the resolution: Choosing a dc compatible to the display which means 96 DPI or choosing a dc compatible to a printer. I need a printer compatible meta file, so it would be ok if there weren't some users who have no printer!

How can I create a dc and set its resolution?

Or is there a way to influence the resolution after creating a meta file?

Thanks for help

Martin
