Hi *.*

I've a strange problem (maybe unormal), I'm using ultragrid 2 build 59 from Infragistics.com which retired now, In this build when grid goes to the edit mode, a textbox created with API and it's parent is the Desktop, after editing is finished then the UltraGrid/Edit sends a WM_NCACTIVATE to the grid's parent form with the wrong parameter: wparam=0, this causes the parent form to draw inactivate!

I can subclass the form and intercept the WM_NCACTIVATE when grid exiting from edit mode and it's ok now, but I'm currently using the CodeJock components for skinning the form and it's nonclient area, when apply the skin, I can't subclass this message with the vbaccelerator ssubtmr6, If I subclass after the skin control then the skinner goes wrong!

I want to know is there anyway to intercept WM_NCACTIVATE from being sent by the grid?

Thanks in Advance,
Hamed
