I've created an ATL Service project. In this project, I create an named event using `::CreateEvent`. I want to share the named event for several process. So I've created another project using MFC, which is an application. But when I try to open the named event in the application, some errors occured. By `GetLastError()`, I get an error code, 5, which means access is denied. Why? And how can I share a named event between a service and an application?
