I'm not very familiar with sockets but I'll look into that, thanks. Having no experience with sockets, and given that the file transfer methods are going to be added to an existing ATL project, would you consider the effort worthwhile?

After posting my first message I came across the concept of IPipeBytes and a nice example project by Richard Grimes. The IPipes seem to be pretty straightforward. Are there any side effects to working with them pipes such as poor performance, security issues, coding complexity or so? Would you consider them more or less suitable than sockets?
