Transient subscription is not functional on W3K3 + SP1.

There is some corruption in registry, catalog or something other because when I try my monitoring application on other W2K3 server then it is functional.

Also when I try MSDN sample ComPlusMon on this damaged system it is not functional – after starting ComPlusMon it seems that all is OK but it does not catch any event (OnMethodCall, OnMethodReturn, OnMethodException) I have tried repairing corrupted catalog by knowledge base article and SP1 reinstall but it does not help.

What can be reason ?

Or does not exist some setting in COM+ system that prohibits transient subscriptions ?

Thanks !

Peter
