

Cookies and multiple sessions

I have a unique situation (may be not so unique).

I have two applications that need to talk to a server through http sessions.

One is a web application that I would launch in IE. Before launching this application in IE, I do a background login using `CHttpFile.SendRequest`, get a cookie and save it in the local cookie store. This way, when the application launches in IE, it is already logged in.

The other is a client running locally that should establish a session with the server (using `CInternetSession`), send some requests, receive responses and logout. (the client talks to a servlet)

Ok, now the issue is, when I launch the second client application, since there is an already established cookie, that cookie gets picked up and recognized by the server and a new session is never created. So, when the client logs out in the last step, the session becomes invalid. At this point, if I try to do anything in the web application that is open in IE, I am taken to the login page.

The question is, how can I force the client to establish a new session? In other words, how can I force the client not to pick up the cookie established by the background login process for the web application?

Is there a better way of what I am trying to do? (hosting the servlet that the client talks to in a different path is not an option)

Thanks

.
