And now I know why I've been using Visual Basic. Support is so much friendlier.

Okay, for anybody that cares... there was no input file. Why? Because the compiler couldn't build it. (I learnt that on my own.) Why couldn't it build it? Because the path (..\notTelling\) was wrong. It was looking for KPDCLoader_Win.c. I don't know why the compiler didn't tell me it couldn't find the source code, but it couldn't, and then tried to use the input file it hadn't created.

My C++ books are at home. I'll get them tomorrow, then I won't have to hear from you again.

Glad I have till tomorrow to finish this project. Too bad you C guys don't document your code. I hate cleaning up after people.
