Ys What ur saying is very true.

We hope MS can't do things against c++ developer.

But some IT industries try to make things favorite to beckon professionals from VC#.net, VB.net & ADO. net as compared to VC. even c# as new to the industry they become tool for mcrosoft technologies in IT ind.

And even some/lot IT biggies migrates it's code from c++ to java native.[i'm not want to tell in specific]

MS keep on chaging it's technologies from c++,vb,c#... and make it's folloewer to be more hectic and need to learn seperate grammar for each thing.

But Sun have a clear in their views. What ever they makes they put all inside java. And u need not to learn new grammar for each its additions. we have to follow same thing for core,bean,jsp,.....all most everything.

A microsoft also traditionally followed these things from microsof C -> vc++ 5.0 -> 6.0 ->7.0 .net with mangaged c++. but parallely vb and newly c#, Why they r doing like this,

And even if i want to sell me in IT market, i have only few buyers. As compared to the other microsoft technologies sellers. But java/mainframe/testers/SAP has almost lot of buyers as we r in support/maintanence/testing/ITES IT industry pool, with little development IT industry.

The main problem is VC is, it's look to be very big thing for new learners as they don't know how sweet it will.

Microsoft can do one thing, they can make some very simple classes/ide for new developers. Ys ms provide dialog based app, but it's no way helpfull to the mfc<->sdk magics.
