Hi, Gary,

Thank you so much for your reply. I am using Window XP Pro with "Language for No-Unicode Programs" setting as Chinese, and "???" is Chinese characters(2 Chinese characters). In both Window XP Pro and Window 2003 computers, I run the client software, I copy the Chinese characters from WindowXP Pro input box to Window 2003 input box(using Microsoft Remote Service). So the user names in both input boxes are the same(Chinese characters are displayed in Window 2003 correctly), but when submit to server, server site receives different strings. Window XP Pro seems to work as expected, but with Window 2003, Server received garbled text for Chinese characters only(English characters are fine). Is there any way that I can fix the problem in my client softare? It is kind of confusing for users, since they can input Chinese character correctly in Window 2003.

Best regards,

Charlie
