I have a memory that it will come out of its ReadFile with (or for async, the notification will contain) an error indication, and the error code (e.g., via GetLastError or other means) will be ERROR_BROKEN_PIPE. If the server disconnects the pipe, that is the end of the session and it would make no sense to send additional information to the server via that pipe. I'd always used an explicit end-of-data notification which one side would send the other to indicate termination, so I never worried too much about the closure issue, except to record errors.
