Well, 'won't compile' is a pretty vague description, and it is impossible to offer advice unless we have some idea as to what error messages you are getting. Does each package produce the same error messages, or do some packages produce error messages different than others. Posting a few representative error messages and the source lines they are associated with would probably help a lot here.

I've definitely used the ExPat package successfully. The MS version seems inordinately fond of DOMs, which are just about totally useless for practical work (you can't build non-tree hierarchies, such as linking nodes together to form a thread, or building a DAG, or a lot of other things that are incredibly useful to do). I wouldn't choose that package as a preference.

But without any idea of what your problems are, there's no way we can help solve them.

Just out of curiosity, I downloaded xerces and it is building right now. So far, a few warnings, but no errors. Of course, I have to use VS.NET 2003 because I still don't have 2005, for some reason or other, but without the error messages we can't tell if you're doing something wrong or its one of the incompatibilities that VS.NET 2005 has.

I am ripping my hair out over this.

I need to find a simple way of loading xml documents into a VS2005 mfc app. I want to be able to add nodes to a document or create a new one, as well as display it.

I have checked out xerces and a package my oracle as well as about 6 (no kidding) differnt packages available.

I also am having trouble with finding a way to use msxml – am I stupid or are the docs slanted towards .net and VB?

Any of the files I've downloaded won;t compile. Am I missing an sdk, I thought it came with VS2005, am I wrong?

Re: XML – one more try...

Please help me on this.

TIA

b
