Haven't played with this for a while but I believe it's a simple matter to change the colors used for the transparent regions of an icon in VS. You should be able to click on the transparent color in the palette or something like that and it pops up a color dialog, where you could change the transparent color to something different.

We use an independent icon editor and are just experimenting with icons for our product. Most of our icons are based around a 'teal' colour (RGB – 128,128,255). However, when we import these icons into Visual Studio and open them, the icon is lost as Visual Studio uses this colour for the default background colour. I know you can change the background colour once an icon is open, but unfortunately it makes most of our icons look rubbish by changing the colour of most of the image, not just the background! We don't want to force the background of our icons to be white, because not everyone uses white as a document colour. The question really is – how can we change the background colour in visual studio before opening an icon?
