Thank you very much! I have visited your homepage and found you are a great computer scientist.

I'm studying windows programming and encountered many difficulties. I've read the famous "windows programming" of Charles Petzold. Now I'm developing a small diary managing software. I want to make it better and shareware or open source it.

I use C++ + SDK to do it and found it's hard to develop a good GUI. I even want to study VB as it's easier.

I ever learned C#, but C# needs CLR and most computers are running without it. So I choose C++, but C++ is harder and VC is not a real RAD IDE. I plan to study MFC. But some people say "MFC is dying". If I use C++, how can I not use MFC? .NET Framework? If using it I think C# is the best choice. What should I do?

I have downloaded the full content of Win32 Programming CD. But I don't have the book. I'll read your code examples.

I see your health is not good. Maybe you need some exercises. Perhaps you could try to run half hours per day.

Best wishes!

My advice: ignore the problem. You are worried about details so infinitesimally uninteresting as to not be worth the effort. Tens of megabytes of data start to be interesting. Anything smaller isn't worth wasting effort on.
