BTW satellite dlls work that way you do use same IDs.
I read in MSDN about that.

You will have to then load the resource from that specific DLL though. I don't think you are doing that. You can use `AfxSetResourceHandle` for it.

This is acknowledged as "best industry standard" at this point.
Same IDs in different dlls, one dll/language, explicitly `LoadLibraryEx` and use that handle to retrieve the resources.
