When I boot VS2005 after a system restore it spends some time reconfiguring itself before opening up, and I now think it is this process which is fixing it (irrespective of the state of other things on the machine).

I saw it hang there also on Thursday (with the panes partially painted) and said, Oh no. I had to do other things, and then left for the day. On Friday morning, when I first came into the office, Vista had rebooted for whatever reason overnight (most annoying all my apps closed and I needed to remember where I was at), and when I launched VS2005, it spent a few minutes with the configuration dialog up. I thought that was strange, but it has worked fine since. Try rebooting a couple times. Microsoft has added so many heuristic hang/crash detectors that you may trigger one of them to fix it for you permanently. :-O

I wish Microsoft would write a log exactly what it updated and when, but I guess that is too consumer unfriendly. ;)
