I am trying to create a software for collaborative browsing(two person browsing together), so there will be a browser(which i m creating) on both the sides and in that browser I want to display a mouse cursor which will represent the other person's cursor, so this cursor is what I want to draw somehow!

that cursor will also move according to the coordinates received from the other person's browser.

More or less yes. What is it exactly that you are trying to accomplish? Are you loading a random page and then want to draw on it?

AliR.

Thanks Alir.
But please tell me more about how do it using the html?
I think I must get the HTML doument make changes to it(drawing) and then
put
it back?

It is not going to be easy, if possible at all. If you want to draw

CHtmlView is a CFormView that has a browser window inside of it that takes up the entire area of the CFormView (m_wndBrowser).

Re: Drawing in CHtmlView

All the drawing is done by and in that control. You will be fighting with control.

In order to draw something in that window you will have to replace that control with your own so that you can catch its WM_PAINT message. This means that you have to create your own CHtmlView class from scratch, and instead of using CWnd as the base for m_wndBrowser, you can use CMyWnd derived from CWnd which can catch the WM_PAINT message and do your own drawing. With all that said, I'm not sure if the browser control will simply paint over what you have painted.

You might also be able to subclass the m_wndBrowser using SetWindowLong, to change it's default window proc.
