I spoke too soon. Looks like the non-SSL connection with standard ports is not working.

Back to the original problem. Here is the info you requested. Any ideas?

Server:
mail.altadyn.com.

Ports:
Outgoing: 465
Incoming: 995
SSL checked on both

Hi Gary,

Thanks, very much.

Ports:
Outgoing: 465
Incoming: 995
SSL checked on both

Your reply prompted me to try unchecking SSL and go back to the default ports of 25 and 110, and when I did the warning stopped.

I suppose that fixes it for now. The server is my company's and I would prefer an SSL connection but it looks like this will require a new certificate.

Do you still think there is something that could inhibit the warning even using SSL and you could determine it with the actual server? If so, is there

Re: Suppressing mail server security certificate warning

a way to send you the server name securely?

Something is telling Windows Mail that it needs to ask the server for a certificate.
Can you tell us the exact server name, port number, and whether SSL is selected?

the problem I am experiencng is related to the lack of a security certificate for an email server from which I am receiving mail with Windows Live Mail.

I want to know if there is a way I can suppress the warning message I receive from Windows Live Mail every time I start the application, or I can otherwise tell the program that this is a trusted server even though there is no certificate. Since I can simply dismiss the warning each time and receive mail I am looking for an automated way, short of requiring this server to install a certificate, to indicate to Windows Live Mail that this is a trusted server.

The warning I get is as follows:

Internet Security Warning
The server you are connected to is using a security certificate that could not be verified.

A certificate chain processed, but terminated in a root certificate which is not trusted by the trust provider.

Re: Suppressing mail server security certificate warning

Do you want to continue using this server?
