Hello,

I'm facing a strange issue when using explorer to create a file or a folder on a network share, it takes about 100 secs to complete. Checking on the server itself the file/folder is created instantaneously but the client is waiting, waiting before displaying it. A complete folder structure copy to the same share is working at a decent speed.

If I use another "explorer" like freecommander, the files/folder creation is immediate. In addition to that it is not happening all the time and not on all the shares on the same server (example : Share A is bad 90% of the time on 90% of the clients and Share B is bad 20% of the times on all PCs,....).

The behaviour is the same in SP1, I tried also to disable Offline files and indexing, I forced also the folder template "Documents" and to "Notspecified".

The "netsh interface tcp set global autotuning=disabled" and "netsh int tcp set global rss=disabled" are done as well

I ran a Wireshark and a Processmonitor and found that the ProcessExplorer displays a "DISCONNECTED" just after receiving the reply of the file creation, and waits a long time before trying to reconnect. I'm looking in two directions :

1. Reduce the timeout between the DISCONNECTED and the re-connection, but I don't know what I should modify.
2. Fix this strange issue.

Any help would be welcome

Patrick
