Hi Jason,

>I tried Leo's method, It's not working for my case. I have been
>checked the installation list from the "Add or Remove Programs"
>of Control Panel, It's a long list but no time stamp associate with.

On this situation, I suggest you perform the following steps to trouble shoot the problem:

Firstly, you can run the following command at a command prompt.

```
C:\WINNT\Microsoft.NET\Framework-rk\v1.0.3705\aspnet_regiis.exe -i
```

Then, restart IIS by running the iisreset command. For details, you could refer to <http://support.microsoft.com/?-id=306005>.

Since your machine is Windows 2000 SP4, the problem would occur if the account that is used to run the ASP.NET Worker process (by default, the ASPNET user account) is not assigned the "Impersonate a client after authentication" user right in the Local Security Policy settings. This issue may occur when you install Microsoft Visual Studio .NET after you install Windows 2000 Service Pack 4 (SP4) on the computer. In this situation, the ASPNET account is not assigned the "Impersonate a client after authentication" user right in the Local Security Policy settings.

The "Impersonate a client after authentication" user right (also named SeImpersonatePrivilege) is a new Windows 2000 security setting that was first included in Windows 2000 SP4.

To work around this issue, please assign the "Impersonate a client after authentication" user right to the ASPNET account in the Local Security Policy settings:

1. Click Start, point to Programs, point to Administrative Tools, and then click Local Security Policy.
2. Double-click Local Policies, and then click User Rights Assignment.
3. In the right pane, double-click Impersonate a client after authentication.

Re: Debugger not working in Vs.net 2003

4. In the Local Security Policy Setting dialog box, click Add.
5. In the Select Users or Group dialog box, click ASPNET, click Add, and then click OK.
6. Click OK.

If the above suggestions don't help, please try the following.

1. Open

C:\WINDOWS\Microsoft.NET\Framework\v1.0.3705\CONFIG\machine.config in Notepad.

2. Locate the processModel section. It looks like:

```
<processModel
```

```
.....
```

```
userName="machine"
```

```
password="AutoGenerate"
```

```
.....
```

```
/>
```

3. Change the userName from "machine" to "system". This section will look like:

```
<processModel
```

```
.....
```

```
userName="system"
```

```
password="AutoGenerate"
```

```
.....
```

```
/>
```

4. Save the file.

5. Run the command "iisreset".

These trouble shooting steps will help us get closer to resolving your issue, so I appreciate your time in performing them. Let me know the results at your earliest convenience. If you have any questions or concerns, please let me know. I am standing by to help you.

Thanks!

Best regards,

Gary Chang
