Very strange problem that is only occurring in one application (that is, I can create a brand new app and not experience this problem).

I have created a handler for Application.ThreadException, in my case in C# that simply displays the unhandled exception.

If I choose "Debug" in the VS.NET 2003 IDE, exceptions never go into the handler so the application, of course, terminates. If I then immediately go into the bin/Debug folder and then run the exact same .exe by double-clicking, the handler is used. Stranger still, once the app is running after double-clicking on it, I can attach the debugger and the handler continues to work.

What am I missing?
James
