LehrSJ,

Someone new needs to go into Visual Studio and select File >> 'Open from Source Control' to open the project.

As far as project locations go, each developer should be checking out files to their own local workspace.

Hope this helps,

Steve – dotneticated.com

I am using TFS for source control. In Visual Studio I can setup a Reporting Services project and add it to source control. If my project is called Reports I can see the source control files Reports.rptproj, Reports.rptproj.vspssc, Reports.sln, and Reports.vsssc are added to the TFS folders. I can add report .RDL files, datasources and easily check them in and out. But what I don't understand is how does another user also setup a Report project that points to this same location so he can also work on the same reports and check them in and out?

If someone else now goes into Visual studio and creates a new Reporting Services project called reports and tries to point it to the same place in TFS, an error message is displayed that the item Reports.sln is already under source control and to use a different folder for the project. But if a different folder is selected, then this project is not going to see the reports under the Reports project.

Re: TFS Source Control, Reporting Services Project, how do multiple us

I am confused. How does more than one person set up a project and use source control and have it point to the same project in TFS source control?
