Johan,

Printing graphics and formatted text fields isn't a problem. I have several programs that do this. To print a PDF you can either get one of the .NET toolkits that support PDF generation and make your own or (as we do) get a PDF printer output driver that prints your document to a PDF file. We use activePDF composer to do the PDF output. For the formatted output I just draw the desired item at the location required on the page using a PrintDocument subclass. For transmission between offices all of our output documents are stored in a set of defined XML formats and then printed from that.
