Hi

I currently have a few projects that I can't just upgrade to .NET 2.0, but I'd still like to make use of the new features as soon as possible. I already have both runtimes running side by side peacefully and looking around this group I also found that the same can be done for Visual Studio. I don't really need my projects to stay compatible with VS2003, but I need the compiled output to be compatible with .NET 1.1. One possibility is compiling using csc.exe from the 1.1 runtime but I was wondering if there's an option in VS2005 to create .NET 1.1 compatible code (of course provided that I'm not making use of anything that's incompatible with .NET 1.1). In java the compiler has the `-source` and `-target` flags that allow me to target a certain JRE. Can the same be done in .NET? Or will binaries compiled against .NET 2.0 run on .NET 1.1 provided I only make use of .NET 1.1 features?

Regards  
Stephan
