Hi,

I downloaded the visual studio c++ express 2005 edition image. I burnt the img file to a CD and browsed through the contents, to find what components are included.

I double-clicked on the dotnetfx.exe (the framework installer) file in wcu folder. It started the installation of the 2.0 beta version, instead of final .net framework 2.0. I found that instead of the final .Net framework 2.0, it contained the beta .Net framework. Is this a problem. I think .Net framework 2.0 final was released about a month before the visual studio express editions. OR Am I missing something.

Can anyone try this out and share the results.

Can I install the .Net framework final 2.0, and get the IDE to point to it, rather than the Beta that comes with it.

I tried posting to the MS forums, but it has some technical problem as of now.

Thanks

.
