

VS2005 Server Explorer and Stored Procedures

Under VS2003, I was merrily dragging and dropping stored procedure objects from the server explorer onto the design pane of my web service, where they would popup as SqlCommands.

This was quite handy for me, as it populated the parameters collection, saving manual typing and synching of data types between my project and the stored procedures themselves.

Having recently updated to VS2005, I was attempting to do the same thing – and while I can get Server Explorer connecting to the data source (SQL2000) fine, dragging and dropping no longer seems to have any effect (it looks like it's working right up until the point when you release the mouse button... then... nothing, no new SqlCommand object).

Is this something I should still be able to do... or has it been removed because my old way is a "bad way of doing things"? And if the former – any ideas on how to make it work.

Thanks,

Richard
