It's not a network, only a local machine. No files are restored. There are no read/write limitations. I'm logged in as Admin. It also happened today after closing and reopening VS. Only one instance was running. I did not change any settings (apart from correcting it again).

Armin,

This may be an artifact of something happening on your local machine or network, rather than a "bug" in VS. When you change the setting, this clearly gets stored either in the registry or in a local file. But consider if either your setting change is not being saved, or if old files are being restored, replacing the changed one. This may be related to write permissions or roaming profiles, or other seemingly unrelated network or file system issues.
