In my VS2003, I have an external tool set up that opens up Explorer to a specified directory, such as the solution directory, or the project directory. It's quite easy to do and extremely useful. However it doesn't work in VS2005, and I think it's because the macros used in the Arguments entry field (such as \$(ProjectDir) append an extra "\" at the end, thus causing iexplorer.exe to fail, saying it can't find the path. Anyone know if this can be corrected, or if it's a legitimate IDE bug, where I can report it?

Thanx!
