The solution is that although the Configuration tool appears to be working for me as a local admin, it is not. I had a net admin make the change to the system and it worked a bit further. Since I am using WSE 1.0 in communicating with some Java SOAP services, I found that the install of WSE did not correctly set up security for the machine to trust the Microsoft.Web.Services.dll and again I was unable to establish trust for the same reason of not being able to trust the original assembly.
