I need some serious help please. I keep getting this annoying message "The current .NET security policy does not permit....." when I deploy my VSTO 2003 project dll in a test machine and try to run it from the browser. The browser actually calls an Excel file which inturn call the dll. The dll propoerties are correctly set in the Excel Template file within the File/Properties/Custom tab. Please note that when I double-click the Excel file from the hard drive folder, everything works fine.

I tried all the different security settings in the .NET 1.1 configuration tool (Trust me, you name a setting, I've tried it) and none of them seem to help. I invariably get the same message. [FullTrust has been given to the assembly from the machine where I'm calling the assembly from]. I even have tried adjusting my browser settings.

Can someone please help. I've tried all sorts of blogs, web sites, microsofts suggessted security settings and none of them seem to help. It's driving me nuts and I have a deadline that is approaching soon.

HELP PLEASE!!!
