| Here is my goal. Have a generic user logged into my
| domain controller that only has the permission to reset
| passwords for user accounts in Active Directory. I want to
| have this user logged in to the domain controller at all
| times and utilize the "run as" command to log on to do
| more major administration tasks such as administer group
| policies, created groups and OUs etc. What's the best way
| to go about setting up this user to only be able to reset
| passwords?

|
|
| Thanks in advance
|

Open Active Directory Users & Computers and delegate control to the account for all of the OUs that contain user accounts.

- 1) Right click on the OU and choose Delegate Control.
- 2) In the delegation of control wizard, select your generic account, then in the next screen select "Create a custom task to delegate".
- 3) In the next screen, choose the radio button for "Only the following objects in the folder", then put a check mark next to User objects, then click next.
- 4) In the Permissions screen, put checks next to "change password", "reset password", and the "read and write account restrictions" permissions. Then click next to finish.
