Hi Doron,

Sorry for the delay in replying.

If I login to 2003SA using the AD Domain Admin account I can programmatically enumerate the messages on 2003SB, and it doesn't throw the exception.

This points the finger at some form of authentication issue, but it is limited to 2003SB as I can enumerate the messages on all the 2000 boxes in the AD domain using my NT login.

Changing the logon to an AD account is not really the solution as I can programmatically enumerate the queues on 2003SA from 2003SB, and I can't give all the users, that use my application, AD domain logons.

In both the NT and AD login cases, I cannot remotely see the Message Queuing tree in Computer Management. Only by using Computer Management locally do I see the tree and the various queues.
