If the servers would be mapped to a newly created DNS and IPCONFIG /RegisterDNS is run on each server would this also create the nec. Netlogon, LDAP and SRV records within the DNS? Would all the clients need to be rebuilt? Btw – After applying MS single domain fix I ran

microsoft.public.win2000.active\_directory: Re: Need to rebuild AD DNS

IPCONFIG /RegisterDNS on the servers. They were still mapped to the original DNS server and nothing was populated in the database. Could this be b/c the DNS was corrupt?
