1. Check SMB signing. Specifically, if RequireSecuritySignature is set to 0x1 (enabled) but EnableSecuritySignature is set to 0x0 then the machines will not talk. Make sure the following registry keys match between client and server:

HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\LanmanWorkStation\Parameters

HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\LanmanServer\Parameters

If one machines requires smb signing but the other does not have it enabled, the machine that does not have it enabled will not be able to communicate with the machine that requires it. An explanation of SMB signing is located within the following article:

823659 Client, Service, and Program Incompatibilities That May Occur When You

<http://support.microsoft.com/?id=823659>

2. You could also be encountering the following problem (could be coming from the a policy other than the local policy):

281648 Error Message: The Account Is Not Authorized to Login from This Station

<http://support.microsoft.com/?id=281648>

| When I try to browse or connect to a member server (with Windows Explorer) from my W2K DC I get the following error:

\\Server1 is not accessible. The account is not authorized to log in from this station.

I can access the server from other servers and workstations.

I can also access the server by using the server's IP Address or FQDN
\\server1.domain.com

Here is the history that led up to this:

Server1 was originally a NT4.0 BDC. I purchased new server hardware, installed W2K SP4, configured as a member server and named the new server Server2.

I removed the original Server1 from the domain. I renamed Server2 as Server1, gave it Server1's IP Address, and joined the domain.

All the shares on the new Server1 are accessible from all servers and workstations (Win98, WinNT, W2K and XP) except from the Domain Controller.

I suspect a disconnect in Active Directory or DNS has the DC confused.
How do I fix it?

|
