Kevin,

Yes it is.

I would suggest that you take a look at the Softwareupdatesvcs NG as there are some really good resources in that NG. There will be some links to the whitepapers that will explain everything that you need to know about SUS.

Please take a look at the following link:

<http://www.microsoft.com/windowsserversystem/sus/default.msp>

This is the homepage for SUS. Take a look around there and you will find your answers.

Essentially, what you need to do is to create an OU, move all of your computer account objects into that OU and then create / link that GPO to that OU. Naturally, you need to first download the SUS SP1 file and execute it on a server of your choice (and that server needs to be running IIS). You can now choose to run SUS on a Domain Controller with SP1 (however, I might avoid this if possible). There will be some settings that you need to configure once you have installed the software.

If you are running WIN2000 SP3 or WIN XP SP1a and above (IIRC) then you do not need to distribute the SUS client (aka Automatic Updates client) to your workstations.

You will just need to add the wuau.adm to your DC (IIRC) in the C:\winnt\inf folder.

There is a really good paper on how to do this called SUS_Deployguide_sp1.doc that will walk you through this process. If I had the link I would gladly give it to you....

HTH,

Cary
