I have to chip in here. Chris' solution is the solution to take, however, GPO processing does occur every 90 mins by default, but once it has applied will not apply again unless the GPO is changed. Therefore, if the users change the group membership after GPO application, it will not get changed again until foreground processing occurs – a logon (or reboot) or secedit /refreshpolicy machine\_policy /enforce (unless you've set the security client side extension to process every time regardless of change).

Hello Jody.

You may not should give them local administrator rights if they not are trusted, the article below shows how you can link the domain admins group to the local admin group, the membership will refresh every time the GPO is re-applied I think, it's every 90min by default.

Restricted groups with in a Group Policy allow to map membership
