Do you have to be a member of domain users in order to access the domain? Also, I tested my first user under the new ou which I setup a group policy. Both the new ou for users and the old users have the same group policy. The test user should get the logon.scr screensaver that locks with the users network password but instead it just allows user to go back to desktop without a password. Under the group policy I setup logon.scr as the exe and a timeout of 600 seconds.? Is the password not working because it is trying to run both group policies. (The user is a member of domain users which is under the old user ou)
